The Art of Connecting

Reuse of the Huber Pavillons

- Critical shift from a linear to a circular economy in the construction sector
- Each chapter connects themes of teaching, practice, and research
- Circular construction principles: reuse of materials from the Huber Pavillons

This in-depth exploration of circular construction principles illustrates the reuse of materials from the Huber Pavillons at the Swiss Federal Institute of Technology (ETH Zurich). The book underscores the critical shift from a linear to a circular economy in the construction sector, with a focus on sustainability and the importance of transdisciplinary and multicultural collaboration. Each chapter connects themes of teaching, practice, and research. Documentation by Elias Knecht.

David Chipperfield Architects

Architecture and Construction Details

- David Chipperfield: Pritzker Prize winner at DETAIL
- Detailed documentation of 25 outstanding projects
- Interviews with David Chipperfield

The projects by David Chipperfield are characterised by clarity and restraint. Founded in 1985, the practice now operates internationally from offices in London, Berlin, Milan, Shanghai, and Santiago de Compostela. Its designs eschew eccentric gestures in favour of harmonious materials, proportions, and forms. This monograph documents the sophisticated solutions of 25 international projects, including new buildings, renovations and interiors realised by David Chipperfield Architects. It offers insights into architectural milestones in urban planning, such as the Morland Mixité Capitale in Paris as well as distinctive interiors like the Valentino flagship stores.

Timber Constructions

in Existing Contexts

- Advantages and possibilities of timber construction in existing buildings
- Advantages over conventional component comparison: eco-balance, statics, prefabrication
- Facade renovation, adding floors, extensions: a catalogue of possibilities

Wood is an exceptionally versatile building material that has been gaining popularity in the construction industry for several years. With skilful involving of various wood types and appropriate construction methods, it can be applied to almost any building task. Its advantages are particularly evident in projects involving existing buildings. This is because it is comparatively lightweight and easy to prefabricate, enabling even structurally demanding extensions to be completed quickly and cost-effectively. Part of the renowned DETAIL Practice series, this book equips architects with the expertise needed to tackle the challenges of their next refurbishment project.

Amsterdam

Urban Architecture and Living
Environments

- Portrait of the Dutch capital and its dynamic architectural scene
- 30 outstanding showcase projects
- Experimental buildings in existing structures, from small private homes to large public buildings

This book documents the most exciting projects in Amsterdam's current architectural scene, including floating houses, hotels in former bridge keepers' cottages, and carefully renovated cultural monuments such as the Felix Meritis or a bicycle garage under a harbour basin. These built showcase projects provide insight into Amsterdam's urban resilience and innovative approaches to housing. Supplementary essays and interviews with leading architects provide a glimpse behind the scenes of their creative processes, completing a portrait of a vibrant and forward-looking architectural culture.

BIG

Architecture and Construction Details

- Insight into processes and design principles
- Architecture, utopia, and pragmatism – BIG shows how they fit together
- Numerous construction details

BIG is a globally active creative group of architects, designers, urban and landscape planners, interior and product designers, researchers, and inventors. BIG's architecture is the result of observing the environment, aligned with contemporary ways of life. The secret of its approach lies in the combination of utopia and pragmatism. This expanded second edition of the monograph shows how this can be realised in practice.

**Timber Buildings
 S, M, L (Vol. 2)**
 30 x Architecture and Construction

- Wood as a traditional building material and a sustainable resource for the future
- Timber for all building types, from small to large
- Compendium of over 60 construction details at 1:20 scale
- Volume 2 features more pioneering timber construction projects

The book illustrates the wide range of design and construction possibilities of wood as a building material, using 30 buildings of different sizes and uses: From small holiday homes and residential and school buildings to large office buildings, factory halls, and cultural and leisure facilities. Various construction methods – including solid timber, modular, frame, skeleton, and hybrid construction – are described in detail.

Masoud Akbarzadeh

Architected Structures

- New potential for architecture, design, and structural design
- Innovative, computer-aided design strategies modelled on the aerospace and automotive industries
- Examples of efficient polyhedral geometries and funicular structures

Computational multifunctional architectural structures reflect a design approach that combines geometry, performance, material, and aesthetics. The term “architectural” in this context means that the structures are designed on a microscopic or macroscopic scale to achieve specific properties such as lightness, strength, flexibility, energy absorption, or even energy generation.

This book explores with efficient polyhedral geometries and funicular, fabric-like structures that extend the limits of existing systems in architecture and structural design, achieving sustainability and functionality. It introduces design strategies that bridge the gap between science and applied technology and show the potential that has yet to be realised in architecture and construction.

”

A building’s long, ongoing conversion history knows no final, finished state. It’s perfectly okay to continue the process and add a few elements that don’t look explicitly new.

An Fonteyne
Architect and Partner,
noAarchitecten

“

Let’s be gentle and not so rough on the stock. Let’s not just throw it all away.

Paul Robbrecht
Architect and Co-Founder,
Robbrecht en Daem architecten

“

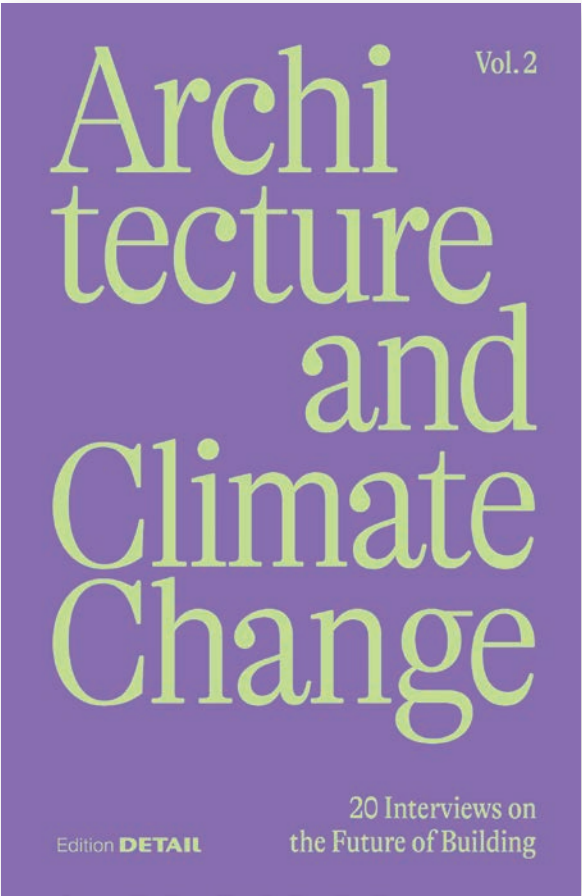

Circular construction is the new standard. Anyone who misses this major change in the architecture and construction fields risks being left behind.

Dominik Campanella
Co-Founder and Managing Director,
Concular

”

A building can be treated as a place where its materials won’t be used once but go on to be reused in a different context – like a material bank storing valuable building materials.

Nora Sophie Griefahn
Founder and Managing Director,
Cradle to Cradle NGO

Sandra Hofmeister (Ed.)
Architecture and Climate Change (Vol. 2)

20 Interviews on
the Future of Building

- International voices on climate-friendly urban planning and architecture
- Decarbonisation: personal experiences, political goals, and concrete proposals
- Outlook on climate-neutral cities, the circular economy in construction, and recycling strategies

Architecture and construction are at a turning point. Global temperature rise can only be slowed if the building industry undergoes radical change. This second volume on architecture and climate change once again gives a platform to 20 architects and urbanists to share their insights on the future of building. It brings together voices from the UK, USA, Denmark, Germany, Japan, and beyond. In the interviews, the experts draw on their own experiences with climate-friendly architecture.
